

Vabilo na Preglov kolokvij / Invitation to the Pregl colloquium

Prof. Krijn P. de Jong

Inorganic Chemistry and Catalysis, Utrecht University, The Netherlands

Email: K.P.deJong@uu.nl

Četrtek / Thursday 16. 3. 2017, ob / at 11:00

Velika predavalnica Kemijskega inštituta /
Great Lecture Hall, National Institute of Chemistry;
Hajdrihova 19, Ljubljana

Catalysis for Fuels and Chemicals

Reliable and affordably energy is a cornerstone of modern societies but concerns about emissions of CO₂ and related climate change are growing. The recent Climate Conference in Paris has led to broad agreement to restrict world temperature increase to 2 °C which translates into a maximum allowable 'carbon budget' of emissions of CO₂ for the coming decades. For transportation fuels we have estimated that for the coming 20 years the required reduction of CO₂ emissions will be contributed for 75% by more efficient usage of fossil energy and for 25% by renewable energy (wind and solar combined with electrification).

Catalysis is at the heart of new and improved processes to deliver fuels and chemicals with a lower carbon footprint. In this talk we address the growing role of processes based on synthesis gas, a mixture of CO and H₂. Synthesis gas can be produced from any carbon-containing feedstock, even from CO₂ if renewable hydrogen is available. We focus on results for conversion of synthesis gas to ultra-clean diesel and to chemicals such as lower olefins. Hydrocracking of n-alkanes using bi-functional Pt/alumina/zeolite-Y catalyst will also be presented. In all these examples effects at the nanoscale play a key role to arrive at improved catalyst activity, selectivity and stability.
